

Project Development Phase

Platform Automation Summary (Model Performance Test — ServiceNow)

Date	
Team ID	
Project Name	ServiceNow-Based Employee Laptop Request Application
Maximum Marks	

This document adapts the standard “Model Performance Test” template to a no-code/low-code platform automation project. Since ServiceNow automations are rule- and flow-based rather than trained models, the parameters below report configuration accuracy and workflow execution accuracy in place of ML metrics.

S.No.	Parameter	Values	Screenshot
1	Automation Setup Summary	ServiceNow scoped application built for Employee Laptop Request Management using a custom Table (Laptop Request Form), a Record Producer on the Service Catalog, a Flow Designer approval workflow, a Business Rule, custom Roles, Groups, and ACLs. Note: if a record is created without a Manager reference, the “Ask For Approval” step cannot resolve an approver and the flow will not route correctly.	See Phase 2 & 3 documentation
2	Configuration Capture Accuracy	Update Set Capture Accuracy — 52 of 52 relevant customizations captured (100%), confirmed via the Customer Updates related list on the “HR Onboarding Application” Update Set.	See Phase 5 documentation
3	Workflow Execution Accuracy	Test Transactions Run — 1 end-to-end submission-to-approval cycle in this test session. Successful Approvals — 1 of 1 (100%) for the functional test performed.	See UAT Template, TC-001–TC-004
4	Business Rule Validation	Duplicate-prevention script reviewed and confirmed logically correct (blocks a 2nd request from the same requester within the same calendar year). A live duplicate-submission test is recommended as a follow-up before final sign-off.	See UAT Template, TC-005
5	Access Control Accuracy	ACL Records Verified — 4 of 4 (Read for it_manager; Read, Create, Write for it_employee) confirmed via the Access Control (ACL) list filtered on the Laptop Request Form table.	See UAT Template, TC-006
